INSTRUCTIONS FOR LAUNCHING THE SCRIPT

Locate in the folder where there is the file **main.py**. This is the file which is used to start the whole program.

The file **main.py** accepts the following options:

- --out_dir: the output directory in which the output files will be stored. We store one image for each picture or picture part and a global picture containing the segmentation of the image. For each image, a folder is created inside out_dir, so the output is grouped by input image. This option is required.
- --input_img: path to the input filename.
- --input_dir: path to a directory containing only image files. Each image in the folder will be analysed.

--input_img and **–input_dir** are not mandatory, but one of them must be specified. If both of them are specified, **--input_img** will be ignored.
